# For Input 1, CRC Delivers Improved Data Security

“It has been a great pleasure and wonderful experience working with CRC to engineer solutions to achieve our organizational goals to improve data availability through online backups.”

*Joe Sarabia, Information Technology Director, Input 1*

## Challenge

- “Our backup consisted of tape backups and daily pickups to an offsite storage facility.”
- “We had a need to augment this because we deemed the exposure to potential data loss to be unacceptable for some of our systems. We wanted to find a way to get our most critical data offsite more quickly while not compromising data privacy and security.”
- “We were looking for a solution that would easily integrate into our existing processes.”
- “We had a requirement that the data be encrypted.”
- “We did not want to increase administrative overhead.”
- “We wanted an efficient solution that would not unnecessarily delay our operations.”

## Solution

- CRC delivered online remote data backup architecture powered by award-winning Asigra® technology, with features like self-healing backup processes, remote and automated administration, and continuous backup.

## Results

- Input 1 gained the ability to remotely protect data at one or more locations from a single point, saving backup administration time while increasing the number of potential recovery points and dramatically reducing the size of hypothetical backup windows. Additionally, Input 1's data is now encrypted with 256-bit AES encryption - the strongest available - protecting it in transit or at rest. CRC's data protection saves Input 1 time and money.
